

USING LIST IN PYTHON

USING LIST

MACHINE PROBLEM 1: IN POSITION

Write a program that creates a list of integers based on the user-inputted size and elements (one input per line). After creating the list, ask for another integer input and print the value located at that index on the next line.

Sample Output 1

```
Enter list size: 5
Enter element 1: 13
Enter element 2: 15
Enter element 3: 74
Enter element 4: 32
Enter element 5: 23
Enter index: 4
Element: 23
```

Sample Output 2

```
Enter list size: 5
Enter element 1: 1
Enter element 2: 2
Enter element 3: 3
Enter element 4: 4
Enter element 5: 5
Enter index: 0
Element: 1
```

Sample Output 3

```
Enter list size: 3
Enter element 1: 1
Enter element 2: 56
Enter element 3: 45
Enter index: 2
Element: 45
```

USING LIST

MACHINE PROBLEM 2: REGROUPING:

Ask the user to create two lists of integers by inputting the size of the two arrays and their elements, respectively.

Print the sum of the first element of the first list and the last element of the second list on the next line.

Also, print the product of the second element of the first list and the second last element of the second list on the next line.

```
Sum of first and last: {sum}Product of second and second to the last: {product}
```

Sample Output 1

Enter size of the first list: 3

Enter element 1: 2

Enter element 2: 4

Enter element 3: 6

Enter size of the second list: 3

Enter element 1: 3

Enter element 2: 6

Enter element 3: 9

Sum of first and last: 11

Product of second and second to the last: 24
